Operating Systems.

Class Test

- 1) In the national banks the Multiframe System has been used.

Multiframe System:

The multiple Framework have been worked in this system.

this system can handle multiple and many concurrent functions at a same time. It is largely Scalable.

✓ Like an OS can perform multi tasks. same this system can handle multiple functions in bank like credit, debit, FD etc... these functions can be occurred smoothly by using Multiframe System.

- 2) Car air bag control System:-

In modern cars the air bags are opened instantly when an collision occurs. The operating system which is used in this is Real time Operating System.

For this application the constraint is time. a slight delay can cause huge damage.

Real time operating system handle this application effectively and it is dependent on time management.

So, Realtime Operating System is suitable for this system.

3) printer / application

3) In this application the printer receives multiple employees prints at a same time.

In this operating system. the Waiting Time Function has been used.

The requests received will be stored in Queue formal First in First out (FIFO). The printer gives print out by calculating the waiting time. The first request will be printed first.

light

4) In this system the storage device is belongs to Secondary Storage Device (SSD) This handles the ~~most~~ of the data in RAM and Secondary Storage. It improves performance of the system.

5) The operation system characteristic used in this is Resource Management which enables the device to handle processor, time memory and storage among all users. This efficiently can share resources. (resource sharing).
